

SPECIFICATIONS

GENERAL:

Dimensions	230 (h) x 78 (w) x 43.5 (d) mm
Weight	850 grams without batteries
Powersupply	8 penlight dry cells (12 volts) or 10 penlight rechargeable nickel-cadmium batteries (12.5 volts) or 12 volt external DC supply.
Cabinet	Aluminium die cast front and high impact ABS back
Channels	80 channels PLL SYNTHESIZED
Controls	volume; squelch; ANL; operate; call; channel
Microphone	internal microphone speaker combination
Semiconductors	3 integrated circuits; 22 transistors; 2 FET; 15 diodes
Special Features	Electronic T/R switching; 40 X 2 channels automatic noise limiter; S. power and battery meter; exchangeable antenna; full accessory connector for remote operation.

RECEIVER:

Frequency range	26.965 to 27.855 MHz in 10 KHz steps
Sensitivity	0.5 μ V for 10dB S + N/N and 100 mW output at 30% 1KHz modulation
Selectivity	6KHz at -6 dB
Adjacent channel rej	better than 50 dB average
Audio output at 10%	250 mW
Spurious response	more than 50 dB down
Intermodulation	more than 50 dB down
Crossmodulation	more than 50 dB down
Squelch sensitivity	less than 0.1 μ V
Noise limiter	automatic series gate

TRANSMITTER:

Frequency range	26.965 to 27.855 MHz in 10 KHz steps
Input power	5 Watt
Modulation capability	100 %
Modulation distortion	less than 5% at 95% modulation
Frequency tolerance	1.200 Hz at -20 to +50 degrees C
External Ant.	50 ohm

0041911

INSTRUCTION MANUAL

CONTROL LOCATIONS:

PACKING LIST:

Beside this manual, the carton shall contain the following items:

- 1 Transceiver TS-5680
- 1 Carrying case with shoulder strap
- 1 Earphone case with earphone
- 2 pcs dummy batteries inside the batterie case
- 1 shortening plug in the accessory jack

GENERAL DESCRIPTION

Your SOMMERKAMP TS-5680 transceiver has been designed for continous heavy duty portable application. It can be operated with external antenna, power supply, headset, telephoneset incorporating automatic voice operated transmit/receive switching, short type rubber antenna, external selective calling with automatic answerback and many more.

GENERAL:

The transceiver is designed to operate with internal dry cells or rechargeable nickel-cadmium batteries such as N500AA set with the 12360 charger, or with an external 12V DC power supply such as NT30, or with an automobile battery. To prevent excessive battery drain, this transceiver has a stand-by switch in combination with the operate and call switch, which by a timing circuit and a switching transistor switches the receiver on for 2 seconds and off for 10 seconds. This device extends the battery life 6 times longer compared with continous squelched stand-by operation. It is necessary, however, for a calling station to call by minimum 10-15 seconds before reception and contact is possible.

RECEIVER SECTION:

The receiver section is designed to receive amplitude modulated signals (AM/A3) in the 26.965 to 27.855 MHz. (11 meter) citizens band. The unique combination of low noise Field Effect Transistors (FET), double conversion, a combination of mechanical ceramic, and L/C filters, fully automatic noise limiter and a hifi quality speaker amplifier will give you exceptional reception quality in this fine piece of equipment.

In addition, the above combination of the latest technology provides you with a sensitivity and unwanted signal rejection and noise suppression available previously only in space and military communication equipment.

The power supply of the receiver section is stabilized by an extreme sharp cut-off Zener diode controlled series stabilizer to obtain the high sensitivity and unwanted signal rejection. The fully automatic series gate noise limiter, which virtually cuts off the audio output during ignition noise pulses, is defeatable to make even the weakest signal audible which otherwise would be cut off by the threshold level of the ANL switching diode.

The high squelch sensitivity is achieved by using a seperate squelch detector and switching circuit with a carefully balanced hysteresis. The transformerless hifi quality audio power amplifier will drive any load between 32 ohms and indefinite such as internal speaker/microphone combination or external speaker/microphone or headset combinations having the above impedances.

The meter indicates the field strength during reception of a signal, and without signal the battery condition.

TRANSMITTER & MODULATOR SECTION:

The transmitter section is designed for continuous heavy duty transmission of amplitude modulated (AM/A3) signals in the 26.965 to 27.855 MHz. (11 meter) citizens band.

The transmitter consists of a Phase Locked Loop circuit and one-crystal controlled oscillator, of which output is synthesized in a class B mixer, followed by a double tuned filter, class AB1 buffers, and a highly efficient collector-modulated class C driver and power output stage, coupled by series and pi-matching filters to the antenna jack and via a loading coil to the rod antenna.

The modulator consists of an input audio filter, integrated pre-and power amplifier and modulation transformer. This gives you the lowest possible modulation distortion and up to 100% modulation. The input is designed for 1 to 10K ohm dynamic microphone or 32 ohm speaker/microphone combination with a 1K ohm resistor in series.

RECEIVE/TRANSMIT SWITCHING:

The receive/transmit switching is done by a single pole, single throw micro switch with a life time of about 5 million operations and a combination of NPN and PNP switching transistors which also function in the receive mode as series voltage stabilizer. For remote switching, a parallel contact is provided at the accessory jack.

METER:

The combination meter provides you with the following functions:
During receive mode.....it indicates the incoming signal strength, and without incoming signals the battery condition.
During transmit mode... it indicates the output power.

CHANNEL DISPLAY

The channel in operation can be read on the digital channel readout display above the channel selecting knob.

When the Display-Normal-Call switch is center switched, the digital channel readout will indicate the number for a few second in order to save battery consumption. However, when the Display-Normal-Call switch frontward switched, the channel readout will stay always indicating the channel number in operation. This position will mainly be used for checking the channel number in use.

POWER SUPPLY:

This transceiver is designed to operate with a nominal 12V DC power supply such as the internal dry cells or nickel-cadmium rechargeable batteries or an external power supply delivering at least 1.5 amperes. The equipment will operate from 10-16V DC without any damage.

UNPACKING AND CHECKOUT

Unpack the carton carefully and check for exterior damages.

Check that the volume control is in the OFF position, the squelch control in the ANL-OFF position and the Display-Normal-Call switch in center position.

Press the dent of the battery compartment lid and pull it out toward the bottom.

Lift out the battery holder and insert 8 dry cells into the holder as indicated, ⊕ to ⊕, ⊖ to ⊖ pole. Leave the 2 dummy batteries in the holder as they are. If you use rechargeable batteries, insert 10 pieces of them in the same manner as above but remove the dummy batteries.

Snap the battery holder onto the snap connector provided and reinsert the holder into the compartment.

Replace the compartment lid by inserting it straight from the bottom up until it snaps in rightly.

Then switch the transceiver ON by rotating the volume control clockwise and check that the meter needle moves into the red field. If the meter needle does not move, switch OFF immediately and check if the Display-Normal-Call switch is in the center position. If this is the case, open the battery compartment to remove the battery holder to ensure that the batteries are correctly inserted.

Now turn the volume control until noise is heard from the speaker. Then extend the rod antenna to the full length.

Rotate the channel selector step by step CH1 to CH40 both for LO & HI CH. and check that some noise and/or signal is heard on each channel.

Push the push-to-talk (PTT) switch and observe the meter needle. It shall move into the red field. Now whistle into the speaker/microphone. The needle shall move a little. The same applies while pressing and releasing the call switch between operate and call.

Repeat this check on each channel from 1 to 40. This completes the checkout.

OPERATION

Extend the rod antenna competely and switch the transceiver ON by rotating the volume control clockwise.

Rotate the channel switch to the desired channel.

Adjust the volume control to a comfortable level.

Press the PTT switch and talk with a normal voice into the speaker/microphone from a distance of 5-10 cm. After completing your transmission, release the PTT switch, and the transceiver is ready for reception. Always remember that your opposite party cannot hear you while he is transmitting.

Adjust the squelch control so that the background noise just disappears during non-transmitting periods of your opposite party.

To answer the received call, push the PTT switch and talk into the speaker/microphone.

To receive weak signals, turn the squelch control fully counter-clockwise so that the ANL is switched OFF.

To switch the transceiver OFF, turn the volume control fully counter-clockwise until a click is heard and the meter needle moves into the black field.

Important:

If you will not operate the transceiver for a long time, remove the batteries from the equipment so that they will not corrode and damage the transceiver. The same applies if you use the transceiver continously with an external power supply.

ACCESSORIES

To install N500AA rechargeable nickel-cadmium batteries, follow the instructions under the Chapter UNPACKING AND CHECKOUT of this manual.

Charge the N500AA nickel-cadmium batteries by plugging the 1236 charger into the charger jack. Charge for 14 hours. It is not possible to operate the transceiver during charging.

To use the transceiver with the NT30AC power supply, plug it into the external power jack. For using a different power supply, it is recommended to select a low ripple, stabilized supply, delivering at lest 1 ampere at 12V with a maximum output voltage of 16V.

To connect the transceiver to a 12V automobile battery, use an 1 ampere fuse in series with the positive wire.

Solder the positive wire to the center of the external power plug and the negative wire to its fin.

In case you use the transceiver with the RA1608 rubber antenna, screw out the telescopic antenna and replace it with the rubber antenna.

For private listening, plug the earphone into the earphone jack. The internal speaker will be disconnected.

To operate the transceiver with a 50 ohm external antenna, plug the coaxial connector into the external antenna jack and remove, if installed, the RA1608 rubber antenna.

MICROPHONE JACK

The 7-pin DIN standard accessory jack has the following internal connections:

- | | |
|-------------------------------------|---|
| 1. Internal speaker | 5. Internal microphone input (Z 1K ohm) |
| 2. AF.out for selective call. | 6. +12V for VOX unit etc. |
| 3. Audio output (Z 8 ohm-10K ohm) | 7. Transmit/Receive switching. |
| 4. Microphone input (Z 600-10K ohm) | Case=ground |

Always operate the transceiver with the microphone plug inserted in the microphone jack, or with the following external connections:

1. Microphone with VOX

5. External microphone/speaker with PTT.

LIST OF CHANNEL FREQUENCY
