

SPECIFICATIONS for TS-732P

Semiconductors:	2 FET, 15 transistor, 20 diode.
Transmitter System:	Crystal controlled. Collector modulation AM.
Frequency:	32 channels on 27 MHz.
Input Power:	10 watts.
Band Width:	8 KHz (max).
Antenna Impedance:	50-52 ohms.
Receiver System:	Single conversion superheterodyne crystal controlled.
Sensitivity:	1 μ V or better for 100mW output, 10dB signal to noise ratio.
Intermediate Frequency:	455 KHz
Receiver Selectivity:	25 dB dc : at 10 KHz.
Squelch Sensitivity:	2 μ V
Audio Output Power:	2 watts in 10 % distortion.
Power Source:	110V AC or 220V AC 11~16.volt D.C. Negative Ground.
Fuse:	AC: 1A DC: 3A
Microphone:	Dynamic type Impedance 500 ohm with press-talk switch.
Speaker:	Dynamic type voice coil impedance 8 ohm.
Size:	156×58×205 mm
Weight:	2.3 kg
Accessories:	Mounting bracket, Mounting hardware AC and DC power cord, Microphone hanger.

CONTROL LOCATIONS:

PACKING LIST:

Beside this manual, the carton shall contain the following items:

- 1 Transceiver TS-732P
- 1 Mounting bracket
- 4 Screw for Mounting bracket
- 1 Microphon hanger
- 1 AC cord with 8 pin connector
- 1 DC cord with Fuse holder and 8 pin connector
- 1 Microphone

GENERAL DESCRIPTION

Your SOMMERKAMP TS-732P transceiver has been designed for continuous heavy duty mobile and base station application. It can be operated with a microphone and internal speaker or headset, speaker/microphone combination, telephone set incorporating automatic voice operated transmit/receive switching, external selective calling with automatic answerback and many more.

GENERAL:

The transceiver is designed to operate from either 110/220 Volt AC or 12 Volt DC powersupply as a base or mobile station. Its straight forward 32 channel capability allows it to operate on any combination of frequencies within 26.5 and 29.7 MHz by inserting the corresponding xtals and retuning the transceiver if required. The Xtals in the transceiver are standard 27 MHz CB Xtals with plus or minus 455 KHz receiver offset. No special synthesiser or IF Xtals are required.

RECEIVER SECTION

The receiver section is designed to receive amplitude modulated (AM/A3) signals in the 26.965 to 27.275 MHz. (11 meter) citizens band. The unique combination of low noise Field Effect Transistors (FET), single conversion, a combination of mechanical ceramic, and L/C filters, fully automatic noise limiter and a hifi quality speaker amplifier will give you exceptional reception quality in this fine piece of equipment.

In addition, the above combination of the latest technology provides you with a sensitivity and unwanted signal rejection and noise suppression available previously only in space and military communication equipment.

The power supply of the receiver RF, IF and oscillator section is stabilized by an extreme sharp cut-off Zener diode to obtain the high sensitivity and unwanted signal rejection. The fully automatic series gate noise limiter, which virtually cuts off the audio output during ignition noise pulses, is defeatable to make even the weakest signal audible which otherwise would be cut off by the threshold level of the ANL switching diode.

The high squelch sensitivity is achieved by using a separate squelch detector and switching circuit with a carefully balanced hysteresis. The transformerless hifi quality audio power amplifier will drive any load between 8 ohms and indefinite such as internal speaker or external speaker/microphone or headset combinations having the above impedances.

The meter indicates the field strength during reception of a signal.

TRANSMITTER & MODULATOR SECTION:

The transmitter section is designed for continuous heavy duty transmission of amplitude modulated (AM/A3) signals in the 26.965 to 27.275 MHz. (11 meter) citizens band.

The transmitter consists of a crystal controlled oscillator. The output of this oscillator is amplified in a class A buffer followed by a tuned filter, and a highly efficient collector-modulated class C driver and power output stage, coupled by series and pi-matching filters to the antenna jack.

The modulator consists of an input audio filter, integrated pre-and power amplifier and modulation transformer. This gives you the lowest possible modulation distortion and up to 100% modulation. The input is designed for 500 to 10K ohm dynamic microphone or 8 ohm speaker/microphone combination with a 1K ohm resistor in series.

RECEIVE/TRANSMIT SWITCHING:

The receive/transmit switching is done by a single pole, single throw switch in the microphone and a combination of NPN and PNP switching transistors.

METER:

The combination meter provides you with the following functions:
During receive mode.....it indicates the incoming signal strength.
During transmit mode...it indicates the output power.

AC POWERSUPPLY

The AC powersupply consists of the heavy duty power transformer, a 4 diode full wave bridge rectifiers and a heavy duty voltage stabiliser for 13.5 Volt for the receiver and transmitter sections.

DC POWERSUPPLY

This transceiver is designed to operate only from a 12V.DC negative grounded powersupply.

BASE STATION INSTALLATION AND CHECKOUT

Unpack the transceiver carefully and check for exterior damages and the accessories.

Connect the 3 wire AC cord to an AC plug in the following manner:

1. blue to AC terminal
2. brown to AC terminal
3. yellow/green to the earth terminal

Connect the antenna plug to the antenna jack with an SWR-Meter inserted into the antenna cable.

Connect the microphone to the microphone jack.

Place the transceiver in operating position and connect the AC plug to a 220 Volt 50 Hz AC output.

Check very carefully that nothing touches the backpanel and that there is a min. 10 cm space between the backpanel and any object nearby because the transmitting transistors will heat up to 100 degree Centigrade and carry a voltage of 14 Volt DC and high power RF.

Switch the transceiver ON.

The receiving, meter and the channel lamp shall light up.

Turn the Squelch control to min. (ANL OFF)

Turn the Volume control to max. until you hear a rushing sound from the speaker.

Switch the channel selector to CH 1.

Push the transmit button on the microphone and check with the SWR-Meter immediately the SWR of your antenna. The SWR must be less than 1 to 2. Do this within 3 seconds, because if the SWR is higher than 1 to 2 it is very likely that the transmitting transistors will be damaged if you operate the transmitter too long with a antenna having a too high SWR. Also read carefully the recommendations on antennas.

If the SWR is less than 1 to 2 continue installation. If it is more than 1 to 2 repair or replace your antenna.

Check that the meter needle is near the red mark during transmitting.

Talk into the microphone. The meter needle shall move a little.

Release the transmit button and switch the channel selector to channel 1, 2 ectr, until you receive a station.

Wait until this station stops to transmit and turn the Squelch control slowly to max. until the background noise just disappears. When the station starts to transmit again, you will hear this station, but you will not hear the background noise during non transmitting periods.

MOBILE INSTALLATION

Mounting bracket and screws are supplied for mounting the transceiver underneath the dashboard. Microphone hanger and screws are also supplied.

For electrical connection, first make sure that the transceiver is turned off. Connect the red wire to the ACC terminal of the ignition switch or + terminal of battery and ground the red and white or black wire to the chassis of the vehicle. The black wire should be grounded as short as possible to minimize noise interference.

This transceiver is designed for use with the negative ground system.

OPERATING INSTRUCTIONS

The transceiver is ready to operate when it is installed with an antenna properly connected. Note that the communication range differs depending upon the environment where the transceiver is operated. You may reach 30 or 40 kilometers where no obstacle exists, but the range may be limited to 5 or 6 kilometers in cities where many high buildings disturb the communication.

- 1) Turn the set on by switching the ON-OFF snap switch to ON and the channel dial will be lighted. Turn the volume control clockwise to increase the audio sound. Note that the volume control knob is only for adjusting the audio volume, not to increase the transmitting power.
- 2) Turn the squelch control clockwise until incoming noise is eliminated. Do not turn it excessively as the sensitivity may be reduced.
- 3) Turn the squelch control counter-clockwise to switch off the ANL (Automatic Noise Limiter)
- 4) Turn the channel selector knob to the desired channel.
- 5) For transmitting, press the button on the microphone and speak into it normally. Release the button for receiving.

METER

The meter reading indicates the signal strength at receiving, and functions as an output indicator at transmitting, and the meter pointer should be within the Red zone under the normal conditions.

MICROPHONE JACK

The 7-pin DIN standard accessory jack has the following internal connections:

1. Microphone input (Z 600-10K ohm)
2. Transmit/Receive switching.
3. Internal microphone output (Z 1K ohm)
4. Internal speaker (Z 8 ohm)
5. Audio output (Z 8 ohm-10K ohm)
6. +12V for VOX unit etc.
7. Ground return for 1-6.

Always operate the transceiver with the microphone plug inserted in the microphone jack, or with the following external connections:

1. Microphone with VOX.

2. Headset or Telephoneset with PTT.

3. External microphone

4. Headset or Telephoneset with VOX

5. External microphone/speaker with PTT.

6. Internal connection
