CIRCUIT DESCRIPTION

PLL CIRCUIT

• Frequency Processing PLL

PLL operation is based on a reference frequency of 10.24 MHz, and allows coverage of the 144 to 146 MHz (E) and the 144 to 148 MHz (K, M) operating band in 5 to 200 Hz steps (50 to 2000 Hz steps for FM), depending on how fast the through-type encoder is turned. When the encoder stops, the selected frequency will be an integral multiple of 5 Hz (50 Hz for FM mode). Figure 2 shows the frequency configuration of the transceiver, and Figure 3, the frequency processing block diagram.

• Reference frequency uses

The 10.24 MHz reference frequency, f_{STD} , is generated by temperature-controlled crystal oscillator (TCXO) X201. The reference frequency is used in four main ways:

- It is sent to various other circuits and used, either directly or after multiplication, as a reference frequency.
- It is input to the PLL IC, IC204 (CXD1225M), on the PLL reference frequency.
- It is input to the FM IF HIC, IC3 (KCD04), via Q201 (2SC2712), when it is used as the local oscillator frequency for squelched FM reception.
- It is doubled to 20.48 MHz by Q202 (2SC2714) to produce the DDS reference signal, which is amplified by Q203 (2SC2712) and input to the DDS subunit (X58-4020-00, 01).

• LO1 (PLL loop)

The VCO subunit (X58-4110-00) generates a signal of 133.305 to 135.305 MHz (E) and 133.305 to 137.305 MHz (K, M). The 10.24 MHz reference signal, f_{STD} , is input to pin 5 of the PLL IC, IC204 (CXD1225M), where it is divided by 20 to produce a 512 kHz comparison frequency. The VCO output is split into two. One signal is amplified by Q216 (2SC2714) and is output to the RF circuit as LO1. The other signal is amplified by Q215 (2SC2714) and input to the Q352 (2SC2714) mixer.

The DDS2 output is mixed with the 10.24 MHz f_{STD} by IC201 (SN16913P). The resulting signal is passed through the band-pass filter to generate a 11.321 to 11.833 MHz signal, which is input to IC202 (SN16913P). This signal and f_{STD} are tripled by Q207 (2SC2714) and Q209 (2SC2714) to generate a 92.16 MHz signal. It is mixed by IC202 and passed through the band-pass filter, amplified by Q211 (2SC2714) to generate a 103.481 to 103.993 MHz signal. The signal is input to Q352 (2SC2714) mixer.

This signal is mixed with the VCO output as the minimum step for the encoder, passed through a band-pass filter to generate a 29.696 to 31.744 MHz signal. It is then passed through Q213 (2SC2714) amplifiers and input to pin 11 of IC204 (CXD1225M). The signal divided by N by the PLL IC is compared with the 512 kHz signal by the phase comparator, and the VCO frequency is locked.

Divide ratio N is transmitted from the control unit as data that covers 144 to 146 MHz (E) and 144 to 148 MHz (K, M) in 512 kHz steps ($N = 58$ to 62 ; a multiple of 2). The divide ratio is changed automatically when the operational frequency is a multiple of 512 kHz, as follows.

When $f = 144.000$, $N = 58$, $f_{DDS} = 1.209$ MHz

When $f = 145.000$, $N = 60$, $f_{DDS} = 1.185$ MHz

• CAR

The DDS1 output is mixed with the 10.24 MHz reference signal f_{STD} by IC203 (SN16913P) to produce a 10.695 MHz signal for local oscillation and detection in modes other than FM. This signal is passed through the ceramic filter and Q206 (2SC2714) amplifier.

In FM mode, the DDS1 stops, and the Q18 (2SC2712) crystal oscillator circuit is operated in transmit mode, and the modulated 10.695 MHz signal is output.

SSB, CW mode switching, IF shift, carrier point fine adjustment, and CW mode pitch change are performed.

CIRCUIT DESCRIPTION

CIRCUIT DESCRIPTION

RECEIVER CIRCUIT CONFIGURATION

Except for FM reception, the receiver uses single conversion with a first IF of 41.415 MHz and a second IF of 10.695 MHz. For FM, double conversion is used with a second IF of 455 kHz.

The signal from the antenna passes through a low-pass filter in the final block, and is switched to the front-end of the RF section system via a diode transmit/receive switch. It then passes through a two-stage high-Q band pass filter, a RF amplifier and a three-stage band pass filter tuned with variable capacitor. The signal then enters the mixer, where it is mixed with the LO1 signal [133.305 to 135.305 MHz (E), 133.305 to 137.305 MHz (K, M)] and so converted to the first IF of 10.695 MHz. The first IF signal is then passes through two-stage MCF, and amplified by junction FET, which passes through as MCF to the IF section.

The IF signal is amplified by a MOS FET IF amplifier and split into two to feed the SSB and FM circuits. In the SSB circuit, the IF amplifier output passes through a crystal filter and enters, goes to the SSB hybrid HIC (KCD08), where it is product-detected. In the FM circuit, the IF amplifier output directly enters the FM hybrid HIC (KCD04), where it is converted to the second IF of 455 kHz and detected. Either of the detected audio signals output from the hybrid HIC can be selected with a analog switch. The selected signal is amplified, passes through a muting circuit and electronic volume control, and is input to the AF amplifier, which drives the speaker. (Fig. 4)

Fig. 4 Receiver circuit block diagram

CIRCUIT DESCRIPTION

• Receiver frontend

The receiver frontend consists of a two-stage high-Q band pass filter, an RF amplifier comprising GaAs FET Q401 (3SK184) three-stage band pass filter tuned with variable capacitor, and a mixer Q402 (3SK131(M)) and an IF amplifier consist of J-FET Q403 (2SK210(GR)).

The gain is controlled by applying the AGC voltage to the second gate of Q401. When the AIP signal is on, Q404 (DTC114EK) turns on, decreasing the AGC voltage and so reducing the gain of Q401 to produce the AIP effect.

• AGC circuit

In the TM-255 the AGC voltage is applied to both Q401 of the RF amplifier and MOS FET Q1 (3SK131) of the IF amplifier. The AGC voltage is detected and amplified by SSB hybrid IC IC2 (KCD08). Since the voltage changes in the positive range only, attenuation is not obtained if it is applied to Q401, which is a GaAs FET. Thus, the AGC voltage is applied directly to the second gate of Q1 as IF AGC, and also applied to the second gate of Q401 by converting the level with the non-inverting amplifier comprising, operational amplifier IC9 (NJM4558M), so that the voltage changes in the negative range as well.

The time constant is automatically switched to SLOW for SSB and FAST for CW by Q17 (2SK208). (Fig. 5)

Fig. 5 Receiver front-end and AGC circuit

CIRCUIT DESCRIPTION

• Noise Blanker Circuit

The IF signal from the RF section is split into two. The part destined for eventual demodulation goes to the IF amplifier, Q1 (3SK131); the other part goes to pin 5 of the noise blanker HIC, IC1 (KCX05), via noise blanker buffer transistor Q3 (2SC2712). The noise blanker HIC amplifies the noise component in the second IF signal, then detects it to produce a control signal that mirrors the presence or absence of noise. This control signal is output from pin 8 of the noise blanker HIC and turns noise blanker switch Q2 (2SC2712) on or off. Q2, in turn, controls the IF amplifier, Q1, so that when there is a noise spike, Q2 switches Q1 from the source to ground, and the noise is blanked.

Fig. 6 Noise blanker circuit

CIRCUIT DESCRIPTION

• S-meter circuit

In modes other than FM, the S-meter circuit uses the RF AGC voltage produced by applying the AGC voltage (IF AGC voltage) output from IC2 through IC9 (1/2) (NJM4558M). The signal is input to IC9 (2/2) (NJM4558M) and amplified and output.

In FM, the level detection signal from IC3 pin 11 is used without modification. The S-meter output is changed by analog switch IC4 (XRU4066BCF) according to the mode, and output to the control unit.

Fig. 7 S meter circuit

• Detection circuit

The signal input to the IF unit is amplified by IF amplifier Q1. In SSB and CW, this signal is split into two: one signal goes to FM detection hybrid IC IC3 (KCD04) for squelch control; the other goes to SSB detection hybrid IC IC2 (KCD08) through crystal filter XF1. The signal is passed through an amplifier in the hybrid IC, mixed with the CAR signal (10.695 MHz), product-detected, and output as an AF signal.

In FM mode, the signal is input to IC3 only and then mixed with the 10.24 MHz oscillator signal applied to HIC pin 3 to generate the third IF signal (455 kHz), which is output from pin 25. The signal is passed through ceramic filter CF1, input to pin 7 again, detected by the quadrature detector with the signal phase-shifted by discriminator CD1, and output as the AF signal.

• Squelch circuit

The TM-255 squelch circuit is of the noise squelch type, and also uses FM hybrid IC IC3 (KCD04) for noise detection in modes other than FM. Therefore, the IF signal is always input to IC3 regardless of the mode.

As the level of the IF signal input to IC3 increases, the noise level decreases. The voltage at IC3 pin 10 (SQ) falls, and pin 9 (SC) goes low. When the SQ pin voltage increases, the SC pin goes high and the current flows through AF mute switches Q7 (2SD1757K) and Q10 (DTC114TK) via R62, turning them on. Thus, the AF signal line is muted.

The SQ pin voltage control method is explained below. The voltage corresponding to the squelch VR angle is read and digitized by the microprocessor in the panel unit. Data is sent to the microprocessor in the control unit. Analog switch IC8 (XRU4066BCF) and Q15 (DTC114EK) are switched according to the data sent to serial-to-parallel converter IC7 (TC9174F). The synthesis resistance between the SQ pin and GND is changed stepwise by connecting R92 to R96 in series or bypassing them.

CIRCUIT DESCRIPTION

Fig. 8 Detection and squelch circuits

CIRCUIT DESCRIPTION

TRANSMITTER CIRCUIT CONFIGURATION

The audio signal from the microphone enters CN5 of the IF unit and is passed through microphone amplifier IC10 (μ PC1313HA). Part of the IC10 output is amplified by Q21 (2SC2712), detected by D15 (1SS355), applied to the ALC pin of IC10, and used to control speech processor operation.

The audio signal amplified by IC10 is passed through Q25 (2SC2712) buffer and electronic volume control IC5 (MB87032PF), and is split into two by analog switch IC13 (XRU4066BCF); one signal is directed to the SSB circuit and the other goes to the FM circuit. In the SSB circuit, the signal is balance-modulated by the CAR signal (10.695 MHz) from the PLL unit by IC14 (μ PC1037HA), passed through crystal filter XF1, and enters IF amplifier Q28 (3SK131). In the FM circuit, the signal enters FM microphone amplifier IC12 (KCA06). It is passed through the pre-emphasis and IDC circuits and output. The output signal is input to varicap diode D7 (1SV164) in the crystal oscillator by Q18 (2SC2712), modulated to the oscillator frequency of 10.695 MHz, and input to Q28.

The signal modulated by type in this way is amplified by Q28, output from CN3 as the first IF (10.695 MHz), and input to CN403 in the RF unit. It passes through a ceramic filter CF401 and mixed with the LO1 signal (133.305 to 135.305 MHz (E), 133.305 to 137.305 MHz (K, M)) input from CN402 by the first mixer Q409 and Q410 (3SK131). The signal passes through four-stage band pass filter tuned by variable capacitor, then RF amplified by Q405 (3SK131 (M)). It is pre-driven by Q406 (2SC2954) and Q407 (2SC1947), and output from CN406 as the drive output.

The drive output enters the final unit through CN601, is amplified to the appropriate level passed through a low-pass filter, and output from the antenna connector.

In CW, Q31 (DTA124EK) in the IF unit is switched with KEY UP/DOWN, and the signal is input to IC1 in the control unit. The sidetone monitor signal is generated by Q39 (2SC2712) in the IF unit, and output from the speaker. The CW control signal (CKS) is output from IC1 in the control unit to switch Q428 (DTC124EK) and Q416 (DTA143EK) and generate the CW signal. The carrier is produced by turning Q14 in the IF unit on, applying DC to IC14, and breaking the balance.

Fig. 9 Transmitter circuit block diagram

CIRCUIT DESCRIPTION

• ALC Circuit

The forward wave voltage detected by the CM coupler in the final unit is detected by D605 (HSM88AS), level-adjusted by VR601, and applied to CN408 in the RF unit. The forward wave voltage is then non-reverse-amplified by IC401 (4/4) (NJM2902M), and input to pin 2 of IC401 (1/4). IC401 (1/4) is a differential amplifier with the power control voltage applied to the + pin (pin 3). When transmission output is present, the output voltage at pin 1 begins to decrease. If the output voltage falls below the ALC reference voltage (about 3.4 V), the ALC operates. The ALC voltage is applied to each second gate of Q405 (3SK131) in the RF unit and Q28 (3SK131) in the IF unit. When the ALC voltage decreases, the voltage of each amplifier and the drive output decrease.

For SWR protection, the reflected wave voltage detected in the same way as the forward wave voltage is level-adjusted by VR603 in the final unit, amplified by Q607 (2SC2712), and applied to the ALC reference voltage by CN408 in the RF unit. The gain is reduced by reducing this voltage to protect the power module when the antenna is not matched.

• Power control circuit

The TM-255 transmission output is switched between high and low. To switch from high to low, press the Low button on the panel. The PH pin of CN409 in the RF unit changes from high to low. Q418 (DTC124EK) and Q417 (DTC124EK) turn off, and VR401 is inserted between the 8 V line and R520, R521. The power control voltage applied to the + pin of IC401 (1/4) decreases and the ALC voltage decreases to reduce the power.

• RF meter circuit

The RF meter circuit non-reverse-amplifies the forward wave voltage with IC401 (3/4) in the RF unit, digitizes its output in the control unit, and displays it.

The TM-255 does not have an ALC meter, but has a meter amplifier because it is required for the auto microphone gain control function, described later. It is a non-reverse amplifier circuit that inputs the ALC voltage to the + pin (pin 5) of IC401 (2/4) and outputs it from pin 7.

Fig. 10 ALC and power control circuits

CIRCUIT DESCRIPTION

• Thermal protection

The TM-255 have fan control and thermal protection, which are controlled by the module unit (X59-4020).

During transmission, Q2 (DTD114EK) in the module unit is always on and the fan runs at medium speed regardless of the temperature. If the final unit temperature rises, IC1 (1/2) (NJM2904M) output (pin 7) goes high and Q3 (DTD114EK) turns on. During transmission, Q2 is on, R611 and R613 are connected in parallel and the fan runs at high speed. When receiving, Q2 is turned off, and only R613 is grounded, and the fan runs at low speed.

If the temperature rises, the output from the IC1 (2/2) goes high and a high signal is output to the power control circuit from the THP pin of CN603. This reduces the transmission output forcibly to protect the transceiver. If the fan fails, Q1 (DTC114EK) is turned off and the THP pin is made high in the same way to reduce the transmission output.

Fig. 11 Thermal protection

CIRCUIT DESCRIPTION

• Auto microphone gain control function (SSB mode)

In a conventional SSB transmitter, the microphone gain volume must be adjusted to gain the ALC properly and keep the output constant. The TM-255 uses an electronic volume control as the microphone gain volume, and automatically controls the microphone gain using the microprocessor according to the ALC effect. This function is available when menu item 61 is turned on (default: on). It can be changed manually if automatic control is not desired or required (when the function is menu No.62). In this case, it can be adjusted in the range -6 dB to +6 dB in 3 dB steps.

If other adjustments are performed, the microphone gain changes gradually, so set the microphone gain control to off (0 dB).

The ALC voltage is amplified by IC1 (1/4) operation amplifier for ALC operation, and input to the A/D converter in the microprocessor. If it is kept in a certain range for a certain time according to this voltage, the microphone gain is changed in 3 dB steps. Its change is shown in figure 12. If the ALC effect is low, the gain is increased, and if it is excessive, the gain is decreased.

Since the range of ± 6 dB is exceeded, it is not followed if the sound is lower than the range, and full power may not be gained. This value has been selected because if the range is extended, the signal-to-noise ratio deteriorates or a sneak path may occur.

The microphone gain can be changed between high and low in FM using this electronic volume control (menu item 60). High: +6dB and Low: 0dB (default:LOW). The gain is also changed even if 9600 bps mode is off.

Fig. 12 Auto microphone gain control

CIRCUIT DESCRIPTION

DATA TERMINAL, PERIPHERAL CIRCUITS AND USE

The data communication connector is on the rear to handle transmission control, data input/output, squelch signal, and relay output. (Fig. 13)

There are two data communication modes: 9600 bps mode (menu item 77 on) and conventional 1200 bps mode (off).

The 9600 bps mode is mainly used for 9600 bps GMSK G3RUH packet communication. This type of high-speed modulation performs frequency modulation by passing the base band signal (square wave) through a filter for bandwidth limiting. This signal is similar to the digitally modulated 4800 Hz signal (similar to a sine wave because it is passed through a filter) in 9600 bps GMSK mode, and sounds like noise. There are GMSK and G3RUH systems according to the type of bandwidth limiting filter. They do not work in SSB.

Data communication in SSB includes 1200 bps/PSK (satellite communication), 300 bps/AFSK packet communication, RTTY, and SSTV. They are used by turning 9600 bps off.

• Transmit signals

The transmission modulation signal enters through PKD. The path to the modulator when 9600 bps mode on menu item 77 is on is different from that when it is off. The path when the DATA terminal PKS is low is different from that when PTT is low. Table 2 lists paths A, B, and C and modulation input levels.

When 9600 bps mode is on, the frequency deviation changes according to the input signal level. A protection circuit is provided to inhibit transmission when the level reaches 4 Vp-p.

The input PKD signal is detected by D23, and smoothed by C146 and R134. If it reaches 4 Vp-p, Q36 turns on and the PTT control (Q35) signal goes low. PKS transmission is inhibited if the input reaches 4 Vp-p.

Pin No.	Name	Specification		
1	PKD		Menu No. 77	
			OFF	ON
		Mod. input Freq. dev.	40mVp-p 3±0.5kHz	2Vp-p 2±0.5kHz
4	PR9	Output level 500mVp-p/10kΩ Always output when RX.		
5	PR1	Output level 300mVp-p/10kΩ No output when squelch is closed.		

Table 2 Data terminal, I/O level

• Receive signals

PR9 is the receive output for high-speed data communication, and the FM detection circuit output (RD signal) is amplified by Q32 and output. The FM detection circuit also operates for SSB/CW squelch in modes other than FM, and the signal is always output regardless of the mode and whether the squelch is open or closed.

PR1 is a signal similar to the conventional speaker output, and output without passing through the electronic volume control. This output is squelch-controlled as in the speaker output.

• Squelch signal/relay output

The squelch signal is input to TNC to prevent collision in packet communication. Table 3 lists the logic and the digital transistor output pulled up by 5 V.

The initial setting is squelch and it can be used as relay output with the internal slide switch. The relay is activated and the signal goes low during transmission. It can be used to control vertical type pre-amplifiers and linear amplifiers.

CIRCUIT DESCRIPTION

DIGITAL CONTROL CIRCUIT

The digital control circuit is divided into two major sections: the LCD assembly containing panel keys, click encoder, VRs, and display circuit and the control unit containing the backup circuit, DTMF circuit, and keys (Fig. 14).

Figure 14 Digital control circuit

CIRCUIT DESCRIPTION

LCD ASSEMBLY AND CONTROL UNIT DATA COMMUNICATION CIRCUIT

Fig. 15 shows the LCD assembly and control unit data communication circuit. SO is serial data out and SI, serial data in. There is a NAND gate between them to protect the microprocessor ports. Data communication is based on start-stop synchronization, and the transmission speed is 31250 bps.

The microprocessor in the control unit checks connection every half second and the microprocessor in the LCD assembly checks connection every five seconds. If a cable is not connected correctly, or the LCD assembly is disconnected, the microprocessors in the LCD assembly and control unit turn the power off.

Fig. 15 Data communication circuit

1. Panel (LCD assembly) microprocessor reset circuit

The panel does not back it up. When the power switch is off, panel microprocessor IC1 (HD404719A46H) controls the 5 V line in the LCD assembly through pin 11 to clear the LCD display and reduce current consumption in the LCD assembly. The panel microprocessor always operates when the main power is on.

The signal from each key on the panel is input to a port. The keys correspond to pins 26 to 42 of panel microprocessor IC1 (HD404719A46H).

The power switch signal is input to pin 56 (INT1) of the microprocessor by edge interrupt. When the signal goes high, the power is on, and when it goes low, the power is off.

With the volume squelch and RIT/IF-SHIFT VRs the voltage output is digitized by dividing 5 V applied to the variable resistor at the analog port of the microprocessor in the panel unit, and reading the change.

The voltage of the VR is read all the time. If it changes, a command corresponding to the value is sent to the control unit.

The display circuit is in the panel unit (LCD assembly), and is controlled by the microprocessor of the panel unit. It consists of an LCD driver and its peripheral circuits.

Serial data is transferred from pins 51, 52, and 54 of the microprocessor of the panel unit, IC1 (HD404719A46H), to the LCD driver. There are 159 segments.

The dimmer circuit changes the brightness of the lamp in five steps (including OFF). Figure 16 shows the dimmer circuit.

Q6 amplifies the error of the stabilized power supply using a 5 V reference voltage. Pins 68 and 69 of the panel micro-processor are open drain, and the output voltage can be output in four steps by combinations of the ports being mode low.

Pin 70 of the microprocessor connected to the emitter of Q5 is also open drain. If it is open, Q5 is turned off, and the lamp voltage is not output. If pin 70 goes low, Q5 turns on and the lamp lights.

CIRCUIT DESCRIPTION

• Control unit

1. Reset circuit

IC7 (M62003FP) monitors V_{cc} applied to the CPU. If the voltage falls below 2.15 V, the IC outputs a reset signal (low) to the CPU, and the CPU initializes all internal data (including memory channel data). The reset signal is not output when the power switch is turned on or off, or 14 V is turned on or off. It is generated only when the battery (BA1) voltage level goes low and 14 V is turned on or off.

C30 generates the signal width (td) required to reset the CPU. (Fig. 17)

Fig. 17 Reset circuit

2. Backup circuit

The TM-255 has two kinds of backup data stored in the CPU and EEPROM. User data, such as memory channel data, is stored in the CPU, and adjustment data, such as meter curves, is stored in the EEPROM.

The EEPROM is backed up when the power supply voltage is off, but power is required to back up the CPU. If 14 V is not cut power is supplied from the 5 V AVR in the digital unit. If 14 V is cut, power is supplied from a lithium battery. To economise on lithium battery use, the CPU must be in backup mode. So when the backup circuit shown in Figure 18 detects a voltage drop in the 14 V line, it outputs a backup request signal to the CPU.

Fig. 18 Backup circuit

CIRCUIT DESCRIPTION

3. EEPROM

Adjustment data is stored in the EEPROM, which consists of 256 16 bit registers. Data can be written to and read from the EEPROM.

Each time the power is switched on, data is read from the EEPROM. If corrupt data is detected, the default adjustment data is used. Adjustment data can be written into the EEPROM in service adjustment mode. (Fig. 19)

Fig. 19 EEPROM

4. PLL and DDS control circuit

The TM-255 has one PLL and two DDSs. The CPU outputs frequency data to the PLLs and DDSs serially according to the display frequency.

5. TX-RX unit control signal circuit

The CPU sends the mode signal and power signal to the TX-RX unit. The CPU receives meter signals and the standby switch signal from the TX-RX unit, and displays data on the meters and performs a transmit operation. The output signal from the CPU goes to serial-to-parallel converter IC7, IC11 (TC9174F). (Fig. 20)

3	Squelch setter signal 2
4	Squelch setter signal 1
5	Squelch setter signal 4
6	Squelch setter signal 5
7	NB
8	RF cut signal
10	SSB mode signal
11	CW mode signal

IC11	
2	FM mode signal
3	High-speed packet signal (PK96)
4	Processor signal
5	Microphone mute signal
6	AIP
7	PTT line switching
8	High-power select signal
9	AF cut signal
10	Beep sidetone

CIRCUIT DESCRIPTION

6. Main unit key A/D input

The voltage divided by the four switches S1-S4 is applied to the A/D input pin of the CPU when a button is pressed.

When two or more buttons in the same group are pressed, only the button with the highest priority is detected (listed below).

KAD		Priority
S1	PROC	1
S2	AIP	2
S3	NB	3
S4	PF	4

Fig. 21 Key A/D input

4. Encoder Circuit

The encoder is a mechanical one. The waveforms of the encoder pulses are rectified by IC6 and IC7 (TC4S584F), and the number of pulses is counted by the hardware counter in the CPU.

When the encoder is rotated slowly, the frequency step is made small; when it is rotated quickly, the step is made large. This ensures smooth tuning and frequency change.

The minimum frequency step is 5 Hz, and the maximum 200 Hz (10 times this value for FM). The frequency step is changed continuously according to the rotational speed. (Fig. 22)

Fig. 22 Encoder circuit

CIRCUIT DESCRIPTION

Menu mode

• Outline of function

There are two menu modes: A and B.

• Functions

1. Menu mode A

In menu mode A, the frequently-used items are set and changed.

Contents of menu mode A

No.	Description	State (display)	Initial state
00	Dimmer change	OFF/d1/d2/d3/d4	d2
01	CW delay time switching	100 - 1800	600
02	CW pitch frequency change	400 - 1000	800
03	Program scan busy stop setting	ON/OFF	ON
04	Busy scan time operate/carrier operate switching	0/1	0
05	All memory scan setting	ON/OFF	OFF
06	Click encoder step frequency switching (SSB/CW)	See instruction manual.	10kHz
07	Click encoder step frequency switching (FM)	See instruction manual.	20kHz
08	AF volume setting	H/L	H

2. Menu mode B

In menu mode B, the items are not changed once they are set.

Contents of menu mode B

No.	Description	State (display)	Initial state
50	Beep tone	ON/OFF	ON
51	Mode Morse setting	ON/OFF	ON
52	Warning Morse setting	ON/OFF	ON
53	Repeater subtone frequency setting	67 - 250.3Hz	88.5Hz
54	Meter peak hold	ON/OFF	ON
55	Standard memory channel frequency temporary change	ON/OFF	OFF
56	Program scan hold function	ON/OFF	OFF
57	RIT frequency variable range 1.1 kHz/2.2 kHz change	1.1kHz/2.2kHz	1.1kHz
58	Automatic power off	ON/OFF	OFF
59	TOT setting	3/5/10/20/30	OFF
60	FM microphone sensitivity change	H/L	L
61	SSB microphone gain control setting	ON/OFF	ON
62	SSB microphone gain setting	-6/3/0/3/6	0dB
63	Paging auto cancel function setting	ON/OFF	OFF
64	Open paging setting	ON/OFF	OFF
65	DTSS delay setting	See instruction manual.	350ms
66	S meter squelch setting	ON/OFF	OFF
67	S meter squelch delay setting	See instruction manual.	500
68	Free encoder lock setting	OFF/F3/ALL	OFF
69	Key lock setting	ON/OFF	OFF
70	MIC PF1 key setting	00 - 99	83 (Menu start)
71	MIC PF2 key setting	00 - 99	33(MR)
72	MIC PF3 key setting	00 - 99	20(A/B)
73	MIC PF4 key setting	00 - 99	24(CALL)
74	Main unit PF4 key setting	00 - 99	85(VOICE)
75	Memory mode frequency display setting	ON/OFF	ON
76	Frequency transverter display setting	See instruction manual.	OFF
77	High-speed packet mode setting	ON/OFF	OFF
78	Auto shift setting	ON/OFF	OFF

SEMICONDUCTOR DATA

CPU: M37702M6B***FP (Control unit IC1)

63	P85	CLK1	I/O	NKB clock		
64	CTS1	CTS1	I	Serial transmission control		L
65	TXD0	PSO	O	Panel data output		
66	RXD0	PSI	I	Panel data input		
67	P81	NC	I			L
68	CTS0	CTS0	I	Serial transmission control		L
69	Vcc		I	Power supply		
70	AVcc		I	A/D power supply		
71	VREF		I	A/D reference power supply		
72	AVss		-	A/D ground		
73	Vss		-	GND		
74	AN7	NC	I			L
75	AN6	NC	I			L
76	AN5	SM	I	S meter		
77	AN4	MDN	I	MIC DWN/PF SW		
78	AN3	MUP	I	MIC UP/PF SW		
79	AN2	PWM	I	RF meter		
80	AN1	ALM	I	ALC voltage		

DTMF encoder: TC35219F (Control unit IC8)

• Pin connection diagram

• Block diagram

• Functions of pins

Pin code	Pin name	Function
1	VDD	Power supply pin
5	VSS	GND pin
2	-TD	Output system select input pin High: The MUTE and TONE Low: MUTE goes low, and TONE goes high.
8	MUTE	Mute output pin Low: Standby state (when -TD input is low); High: Operating state regardless of whether a valid tone is output or not.
14	TONE	Tone output pin Dual tone or single tone is output according to each input.
6	OSCOUT	Oscillator circuit input/output pin
7	OSCIN	
3	CONT1	Single tone output select input pin Normally high. The single tone can be output by the operation.
4	CONT2	
12	DATA1	Data input pin 4 bit data is input.
11	DATA2	
10	DATA3	
9	DATA4	
13	-PS	Oscillation control input pin. High: The register latches data of DATA1 to 4, and CONT1, 2 on a rising pulse of -TD. When -TD is low, oscillation stops.

SEMICONDUCTOR DATA

DTMF decoder: LC7385M (Control unit IC9)

• Pin connection diagram

• Block diagram

• Functions of pins

Pin No.	Name	I/O	Description
1	IN ⁺	I	Non-inverted input of input amplifier
2	IN ⁻	I	Inverted input of input amplifier
3	GS	O	Output of input amplifier
4	VREF	O	VDD/2 reference voltage output
5	B/H	I	Select the output format for Q1 to Q4. High: Binary (2 of 8) code Low: Hexadecimal code
6	PD	I	High: Power down mode
7	OSC1	I	Connect a 3.579545 MHz crystal between these pins to form an oscillation circuit.
8	OSC2	O	
9	Vss		Power supply pin. Normally 0 V
10	TOE	I	Control the three-state output for Q1 to Q4. High: Enable Low: High impedance
11	Q1	O	Three-state receive data output
12	Q2		
13	Q3		
14	Q4		
15	STD	O	High when the valid tone pair continuation time exceeds the time set by CR
16	ES	O	High when a valid tone pair is detected
17	S/GT	I/O	Set the guard time by connecting CR.
18	VDD		Power supply pin. Normally 5 V

SEMICONDUCTOR DATA

Electronic volume control: MB87032PF (TX-RX unit IC5)

SEMICONDUCTOR DATA

• Functions of pins

Pin No.	Pin name	I/O	Function	Remarks
1	AG	-	Analog ground pin	
2	L-IN1	I	Analog input pin Drive with low impedance (100 or less).	L and R are symmetrical. Analog input
23	R-IN1	I		
4	L-IN2	I		
21	R-IN2	I		
5	L-IN3	I		
20	R-IN3	I		
 Fig. 1 Connection of each input pin of electronic volume The volume, loudness, and tone are determined by the R1, R2, C1, C2, and C3 values (including open and short) shown in Figure 1.				
6	L-1/2VDD	O	1/2VDD output pin.	L and R are symmetrical.
19	R-1/2VDD	O		
8	L-OUT	O	Electronic volume control output pin. Since the output is high impedance, an error occurs if the impedance at the next stage is low.	Analog input
17	R-OUT	O		
11	DG	-	Digital ground pin.	
12	CK	I	Clock signal input pin Clock signal input pin for reading data from DATA pin.	TTL interface Digital input
13	DATA	I	Volume, tone, channel select data input pin. 28 bit data is input serially with clock signal.	
14	CS	I	Strobe signal Read and latch the control data read through the CK and DATA pins on a rising edge of the CS signal. If strobe is not input, the previous control data is retained.	
24	VDD	-	8V power connection pin	
-	NC	-	No connection	

• Maximum rating

Item	Code	Pin No.	Standard value			Unit
			Minimum	Standard	Maximum	
Power supply voltage	VDD	24	-	-	10	V
Input voltage	VIN	All input pins	GND-0.3	-	VDD+0.3	V
Output voltage	VOUT	All input pins	GND-0.3	-	VDD+0.3	V
Storing temperature	Tstg	-	-50	-	125	°C

• Recommended operating conditions

Item	Code	Pin No.	Standard value			Unit
			Minimum	Standard	Maximum	
Power supply voltage	VDD	24	6	8	10	V
Digital input voltage	VDI	12, 13, 14	0	-	VDD	V
Analog input voltage	VAI	23	-	1	1.4	Vrms
Operating temperature	Ta	-	0	-	70	°C

TM-255A/E

DESCRIPTION OF COMPONENTS

X57-4530-00, -11 TX-RX unit (A/5 IF)

Component No.	Use/function	Operation/condition/compatibility
IC1	HIC	NB
IC2	HIC	SSB, CW detection, AGC voltage output
IC3	HIC	FM detection, noise squelch, FM S meter
IC4	Analog switch	Switching of detection output and S meter output between FM and other mode
IC5	Electronic volume control	Right channel: Transmission (microphone gain); Left channel: Reception (AF volume)
IC6	AF amplifier	
IC7	Serial-to-parallel conversion	
IC8	Analog switch	Squelch setting
IC9	Operational amplifier	RF AGC, SSB, CW S meter
IC10	Microphone amplifier	SSB, FM common/speech processor
IC11	Serial-to-parallel conversion	
IC12	HIC	FM microphone amplifier
IC13	Analog switch	MIC signal switching
IC14	Balanced modulator	SSB modulation
Q1	IF amplifier	Receive operation
Q2	Switching	NB gate
Q3	Buffer amplifier	NB HIC (IC1) input
Q5	Switching	Squelch hysteresis
Q6	Amplifier	Receive audio signal
Q7	Switching	AF mute, squelch
Q8	Switching	AF level down (-6 dB)
Q10	Switching	AF mute, squelch
Q11	Switching	On for SSB, CW
Q12	Switching	On for FM
Q13	Switching	On for SSB
Q14	Switching	On for CW
Q15	Switching	Squelch setting
Q16	Switching	On when transmitting FM (frequency modulation circuit power switch)
Q17	AGC time-constant switching	On for SSB
Q18	Crystal oscillator circuit	For frequency modulation
Q19	Buffer amplifier	Frequency modulation circuit output
Q20	Switching	On: 9600 bps (PK96 "high")
Q21	Amplifier	Microphone amplifier output detection
Q22	Switching	On: PROC on
Q23	Switching	Microphone mute (on when DTMF is sent or received)
Q24	Switching	PROC on (microphone amplifier gain switching)
Q25	Amplifier	Microphone amplifier output
Q26	Switching	9600 bps on/PKS low off
Q27	Switching	Off when PKS is low
Q28	IF amplifier	Operates when transmitting (ALC)
Q29	Switching	On when transmitting
Q30	Relay driver	On when Q29 is on
Q31	Switching	On: Key down
Q32	Amplifier	PR9 (FM detection output without squelch control)

DESCRIPTION OF COMPONENTS

X57-4530-00, -11 TX-RX unit (A/5 IF)

Component No.	Use/function	Operation/condition/compatibility
Q33	Amplifier	PR1 (demodulated output with squelch control)
Q34	Switching	On when PKS is low
Q35	Switching	On when PKS is low and Q36 is off
Q36	Switching	On when PKD input is excessive (4 Vp-p)
Q37	Switching	On when squelch is closed
Q38	Switching	RD mute. On when transmitting
Q39	Oscillator	Sidetone generation
Q40	Ripple filter	AF amplifier power supply
D1	Reverse flow prevention	
D2	Reverse flow prevention	MRD input protection
D3, 4	Switching	Crystal filter transmission/reception switching (operates in SSB and CW)
D5, 6	Switching	Crystal filter pass prevention (operates in FM)
D7	Varicap diode	Frequency modulation
D8	Voltage stabilization	5V
D9	Switching	RXE and BSY OR circuit
D10	Reverse flow prevention	
D11	Switching	PTT and PKS OR circuit
D12	Switching	SSB, SW mode signal OR circuit
D13, 14	Reverse flow prevention	
D15	Detection	Microphone amplifier output detection, PROC control
D16	Switching	PTT change signal and mute OR circuit
D17	Switching	PTT and mute OR circuit
D18	Switching	PK96 and PKS OR circuit
D19	Reverse flow prevention	
D20	Relay surge absorption	
D21	Reverse flow prevention	
D22	Switching	KYS and sidetone generator power supply OR circuit
D23	Detection	PKD
D24	Reverse flow prevention	
D25	Temperature compensation	
D26	Switching	
D27	Reverse flow prevention	
D28	Switching (Reverse flow prevention)	
IC201	Mixer	1: 11.321-11.833 MHz output; 2: 10.24 MHz input; 5: 1.081-1.593 MHz input
IC202	Mixer	1: 103.481-103.993 MHz output; 2: 92.16 MHz input; 5: 11.321-11.833 MHz input
IC203	Mixer	1: 10.695 MHz output; 2: 0.455 MHz input; 5: 10.24 MHz input
IC204	PLL	2, 3, 4: Divide ratio setting input; 5: 10.24 MHz input; 7: Lock voltage output; 8: Unlock output; High: UL; 11: 29.696 - 31.744 MHz input
IC205	Three-pin regulator	Constant-voltage 8 V output
IC206	Three-pin regulator	Constant-voltage 5 V output
Q201	Buffer amplifier	10.24 MHz
Q202	Double circuit	10.24 MHz * 2
Q203	Amplifier	20.48 MHz, DDS (A201, 202) CLK input
Q204	Buffer amplifier	10.24 MHz, mixer (IC203) input
Q206	Amplifier	10.695 MHz

TM-255A/E

DESCRIPTION OF COMPONENTS

X57-4530-00, -11 TX-RX unit (A/5 IF)

Component No.	Use/function	Operation/condition/compatibility
Q207	Triple circuit	10.24 MHz * 3
Q209	Triple circuit	30.72 MHz * 3
Q210	Buffer amplifier	10.24 MHz, mixer (IC201) input
Q211	Amplifier	103.481-103.993 MHz, mixer (Q352) input
Q213	Amplifier	29.696-31.744 MHz, PLL (IC204) input
Q214	Amplifier	VCO (133.305 - 135.305 MHz (E), 133.305 -137.305 MHz (K, M)) output
Q215	Amplifier	133.305 - 135.305 MHz (E), 133.305 -137.305 MHz (K, M), mixer (Q352) input
Q216	Amplifier	LO1 (133.305 - 135.305 MHz (E), 133.305 -137.305 MHz (K, M)) output
Q217-Q219	Active low-pass filter	PLL
Q220	Switching	On: Unlock
Q352	Mixer	IN1: 103.481-103.993 MHz; IN2: 133.305 - 135.305 MHz (E), 133.305 -137.305 MHz (K, M); OUT: 29.696 - 31.744 MHz

DESCRIPTION OF COMPONENTS

X57-4530-00, -11 TX-RX unit (B/5 RF)

Component No.	Use/function	Operation/condition/compatibility
IC401	Operational amplifier	ALC, power meter
IC402	Three-pin regulator	Constant-voltage 8 V output
Q401	RF amplifier	Operates when receiving (145 MHz)
Q402	RX first mixer	IN: 144 - 146 MHz (E), 144 - 148 MHz (K, M) OUT: 10.695 MHz, LO1: 133.305 - 135.305 MHz (E), 133.305 - 137.305 MHz (K, M)
Q403	2nd IF amplifier	Operates when transmitting (10.695 MHz)
Q404	Switching	On when A/P is on
Q405	TX IF amplifier	Operates when transmitting (ALC)
Q406, 407	Drive, predrive amplifier	Operates when transmitting
Q409, 410	TX first mixer	IN: 10.695 MHz, OUT: 144 - 146 MHz (E), 144 - 148 MHz (K, M), LO1: 133.305 - 135.305 MHz (E), 133.305 - 137.305 MHz (K, M)
Q416	Key switch	On when Q428 is on
Q417, 418	High/low changeover switch	On: High power
Q419-Q421	Multivibrator	DC/DC converter (-6 V)
Q422	RXB switching	On when receiving
Q423	TXB switching	On when transmitting
Q424	Switching	On when receiving
Q425	Switching	On when transmitting
Q426	Switching	On when receiving
Q427	Switching	On when temperature rises excessively (power-down control)
Q428	Key switch	On: Key down in CW
Q429	TX IF gain switching	On: High power
D425	RF amplifier protection	
D405, 407, 409, 426	Varicap	Operates when receiving
D410	Voltage stabilization	-0.6 V
D411	Switching	LO1 transmission/reception switching
D412, 413, 414, 415, 416	Varicap	Operates when transmitting
D417	Temperature compensation	
D419	Rectification	ALC voltage
D422	Double-voltage rectification	
D423	Voltage stabilization	-6 V
D424	Reverse flow prevention	
D427	Reverse flow prevention	

TM-255A/E

DESCRIPTION OF COMPONENTS

X57-4530-00, -11 TX-RX unit (C/5 FINAL)

Component No.	Use/function	Operation/condition/compatibility
Q601	Switching	On when over-voltage occurs
Q602	Power switch control	On when Q608 is off and PSW is high
Q603	Power switch	On when Q602 is on
Q604-606	DB AVR	12 V output when transmitting
Q607	SWR protection control	
D601, 607	Antenna switch	On when transmitting
D602	Protection diode	Power supply reverse connection prevention
D603	Surge voltage absorption	+B line
D604	DC over-voltage detection	
D605	Reverse flow prevention	
D606	DB AVR temperature compensation	
D608, 609	RF power detection	
D610	Surge voltage absorption	Fan motor
IC601	Final amplifier	

X57-4110-00 VCO

Component No.	Use/function	Operation/condition/compatibility
Q1	VCO	
Q2	Buffer amplifier	VCO output, 133.305 - 135.305 MHz (E), 133.305 - 137.305 MHz (K, M)
D1	Varicap diode	

X57-4020-00 FAN

Component No.	Use/function	Operation/condition/compatibility
IC1	Comparator	Fan control
Q1	Switching	On when the fan runs
Q2	Fan motor drive	On when transmitting
Q3	Fan motor drive	On when the temperature rises
D1	Switching	OR circuit

DESCRIPTION OF COMPONENTS

X53-3510-12, -21, 2-72 CONTROL unit

Component No.	Use/function	Operation/condition/compatibility
IC1	CPU	See circuit description and semiconductor data.
IC2	Reset	When the power is on
IC3	EEPROM	4K byte
IC4, 5	Serial data inverter buffer	When the control unit communicates with the LCD assembly
IC6, 7	Encoder pulse waveform shaping	When the encoder is turned
IC8	DTMF encoder	See circuit description.
IC9	DTMF decoder	See circuit description.
IC10	3-to-8-line decoder	Serial-to-parallel conversion
IC11	Analog switch	DTMF receiver
IC12	Three-pin regulator	Constant-voltage 6 V output
Q1	Switching	Switch DTMF signal between dual and single tones.
Q2, 3	Switching	Destination judgement
Q4, 5	Switching	ON AIR LED, BUSY LED lighting control
Q6	Switching	Unit 5 V control
Q7	Amplifier	DTMF monitor
Q8, 9	Switching	Backup judgement
D1	Switching (Reverse flow prevention)	CPU power supply OR circuit
D3, 4, 5	Protection diode	Input port protection
D9, 10, 11, 12, 15	Switching	Destination selection
D16, 17	Reverse flow prevention	
D18	LED	Lights when busy (green).
D19	LED	Lights when on air (red).
D20	Reverse flow prevention	
D21	Voltage shift	Backup detection

TM-255A/E

ADJUSTMENT

OUTLINE OF ADJUSTMENT MODE

The adjustment items on the service adjustment mode menu are set in service adjustment mode. The data is updated when a write operation is performed with the switch on menu No. B3, Write into EEPROM. The following items must be set as shown to adjust correctly:

• Settings for adjustment

Item	Setting
IF-SHIFT	Center (0Hz)
RIT	OFF
AIP	OFF
NB	OFF
Power	HIGH
Microphone gain control by ALC	OFF

• Frequencies and modes for adjustment

Menu No.	Frequency	Mode	TX/RX
A0	145.040	FM	RX
A1	145.040	FM	RX
A2	145.040	FM	RX
A3	144.950	LSB	TX
A4	144.950	USB	TX
A5	144.039	USB	RX
A6	144.039	USB	RX
A7	144.039	USB	RX
A8	145.040	FM	RX
A9	145.040	FM	RX
AA	144.950	USB	TX
AB	144.950	USB	TX
AC	144.950	USB	TX
AD	144.780	FM	TX
AE	144.950	USB	TX
AF	144.950	USB	TX
B0	144.950	USB	TX
B1	144.980	FM	TX
B2	144.950	USB	TX
B3	145.040	FM	RX

SERVICE ADJUSTMENT MODE MENU

Menu No.	Menu contents
A0	Checksum display
A1	RIT VR mechanical center correction
A2	IF-SHIFT VR mechanical center correction
A3	LSB carrier point adjustment
A4	USB carrier point adjustment
A5	S meter curve adjustment (except FM) S1
A6	S meter curve adjustment (except FM) S9
A7	S meter curve adjustment (except FM) Full scale
A8	S meter curve adjustment (FM) Start
A9	S meter curve adjustment (FM) Full scale
AA	RF meter curve adjustment (low)
AB	RF meter curve adjustment (middle)
AC	RF meter curve adjustment (high)
AD	DTMF single tone output
AE	ALC start (for microphone gain control by ALC)
AF	ALC zone max. (for microphone gain control by ALC)
B0	ALC zone max. + 6 dB (for microphone gain control by ALC)
B1	FM microphone gain (high level)
B2	SSB microphone gain
B3	Write into EEPROM

ADJUSTMENT

PANEL OPERATION IN ADJUSTMENT MODE

Setting

- 1) Hold down the NB and MHz keys and switch the power on. (Turn the encoder to change the menu number.)
- 2) When the UP or DOWN key is pressed, the menu number is set.
- 3) Menu numbers A1 to A9 and AA to AC can be used in adjustment mode.
- 4) Press the CLR key to cancel adjustment mode. (It is also canceled when the power is turned off.)

ADJUSTMENT

A0 CHECKSUM DISPLAY

- Adjustment function

Displays the version of the installed program. Displays the two low-order bytes of the checksum obtained by adding all the program codes.

- **Display**

- Adjustment procedure

None

A1 RIT VR MECHANICAL CENTER CORRECTION

- Adjustment function

Input the RIT control center position to the microcomputer so that the RIT frequency is zero when the RIT control is at the center position on the panel.

- Adjustment procedure

1. Set the RIT control to the center position on the panel.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Remarks

The center position can be input unconditionally without pressing the key. However, the key must be pressed to prevent this menu item data from being modified accidentally when the RIT control is not at the center. When the key is pressed, data is updated and the two displays match.

- **Display**

ADJUSTMENT

A2 IF-SHIFT VR MECHANICAL CENTER CORRECTION

• Adjustment function

Input the IF-SHIFT control center position to the microcomputer so that the IF-SHIFT frequency is zero when the IF-SHIFT control is at the center position on the panel.

• Adjustment procedure

1. Set the IF-SHIFT control to the center position on the panel.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Remarks

The center position can be input unconditionally without pressing the key. However, the key must be pressed to prevent this menu item data from being modified accidentally when the IF-SHIFT control is not at the center. When the key is pressed, data is updated and the two displays match.

• Display

The input A/D value is displayed. (0-FFH)

The current A/D value for the IF-SHIFT control center stored in the microcomputer is displayed. (0-FFH)

A3 LSB CARRIER POINT ADJUSTMENT

• Adjustment function

Adjust the carrier point in 10 Hz steps to correct variations of the IF filter center frequency in LSB mode.

• Adjustment procedure

1. Transmit.
2. Change the correction frequency with the F.LOCK/LOW key or MIC UP/DOWN key.

• Remarks

The plus sign (+) indicates the frequency is moving away from the carrier frequency. (Same as IF-SHIFT)

• Display

Sign (+: blank)

The correction frequency (Hz) for the center frequency is displayed.

ADJUSTMENT

A4 USB CARRIER POINT ADJUSTMENT

• Adjustment function

Adjust the carrier point in 10 Hz steps to correct variations of the IF filter center frequency in USB mode.

• Adjustment procedure

1. Transmit.
2. Change the correction frequency with the F.LOCK/LOW key or MIC UP/DOWN key.

• Remarks

The plus sign (+) indicates the frequency is moving away from the carrier frequency. (Same as IF-SHIFT)

• Display

A5 S METER CURVE ADJUSTMENT (S1) (ANY MODE EXCEPT FM)

• Adjustment function

Input the S meter voltage at which two bars of the S meter light to the microcomputer to correct variations of the S1 level of the S meter.

• Adjustment procedure

1. Input the specified level at which S9 begins to light with the SG.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The threshold is the input level minus the fixed value (9 approximately 0.18 V). When the input signal exceeds the threshold, one bar of the S meter lights. The curve between S1 and S9 is obtained from the levels of menus A5 and A6 by line approximation. Only the A/D values of the S1, S9, and full-scale levels are stored in the EEPROM. The meter bars operate according to the currently set curve. The curve is calculated when the key is pressed. The default for S1 is 63, approximately 1.24 V.

ADJUSTMENT

A6 S METER CURVE ADJUSTMENT (S9) (ANY MODE EXCEPT FM)

• Adjustment function

Input the S meter voltage that indicates S9 (the first large segment) to correct variations of the S9 level of the S meter.

• Adjustment procedure

1. Input the specified level at which S9 begins to light with the SG.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The curve between S1 and S9 is obtained from the level of menus A5 and A6 by line approximation. The curve between S9 and full scale is obtained from the levels of menus A6 and A7 by line approximation. The meter bars operate according to the currently set curve. The curve is calculated when the UP/DOWN key is pressed. The default for S1 is 121, approximately 2.37 V.

A7 S METER CURVE ADJUSTMENT (FULL SCALE) (ANY MODE EXCEPT FM)

• Adjustment function

Input the S meter voltage at which all the segments of the S meter light to correct variations of the full-scale level of the S meter.

• Adjustment procedure

1. Input the specified level at which S9+40 dB begins to light with the SG.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The curve between S9 and full scale is obtained from the levels of menus A6 and A7 by line approximation. The meter bars operate according to the currently set curve. The curve is calculated when the key is pressed. The default for full scale is 158, approximately 3.10 V.

ADJUSTMENT

A8 S METER CURVE ADJUSTMENT (S1) (FM)

• Adjustment function

Input the S meter voltage at which two bars of the S meter light to the microcomputer to correct variations of the S1 level of the S meter.

• Adjustment procedure

1. Input the specified level at key S1 begins to light with the SG.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The threshold for the S meter start is the input level minus the fixed value (1; approximately 0.02 V). When the input signal exceeds the threshold, one bar of the S meter lights. The curve between S1 and full scale is obtained from the levels of menus A8 and A9 by line approximation. Only the A/D values of the S1 and full-scale levels are stored in the EEPROM. The meter bars operate according to the currently set curve. The curve is calculated when the key is pressed.

The default for S1 is 111, approximately 2.18 V.

A9 S METER CURVE ADJUSTMENT (FULL SCALE) (FM)

• Adjustment function

Input the voltage at which all the segments of the S meter light to correct variations of the full-scale level of the S meter.

• Adjustment procedure

1. Input the specified level at which S9+40 dB begins to light from the SG.
2. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

Only the A/D values of S1 and full-scale are stored in the EEPROM. The meter bars operate according to the currently set curve. The curve is calculated when the key is pressed. The default for full scale is 143, approximately 2.80 V.

ADJUSTMENT

AA RF METER CURVE ADJUSTMENT (LOW)

• Adjustment function

Input the voltage at which the RF meter indicates scale 2 to the microcomputer to correct variations of the low level of the RF meter.

• Adjustment procedure

1. Transmit.
2. Connect the AG to the microphone socket and input the specified level at which RF 2 begins to light.
3. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The threshold for the RF meter start is the input level minus the fixed value (19; approximately 0.37 V). The curve is obtained from the levels of menu AA and the start level by line approximation. The curve between 2 and 6 is obtained from the levels of menus AA and AB by line approximation. Only the A/D values for 2, 6, and full scale are stored in the EEPROM. The meter bars operate according to the currently set curve. The curve is calculated when the key is pressed. The default is 56, approximately 1.10 V.

AB RF METER CURVE ADJUSTMENT (MIDDLE)

• Adjustment function

Input the voltage at which the RF meter indicates scale 6 to the microcomputer to correct variations of the middle level of the RF meter.

• Adjustment procedure

1. Transmit.
2. Connect the AG to the microphone socket and input the specified level at which RF 6 begins to light.
3. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The curve between 2 and 6 is obtained from the levels of menus AA and AB by line approximation. The curve between 6 and full scale is obtained from the levels of menus AB and AC by line approximation. Only the A/D values for 2, 6, and full scale are stored in the EEPROM. The meter bars operate according to the currently set curve. The curve is calculated when the key is pressed. The default is 114, approximately 2.24 V.

ADJUSTMENT

AC RF METER CURVE ADJUSTMENT (HIGH)

• Adjustment function

Input the voltage at which all the segments of the RF meter light to the microcomputer to correct variations of the full-scale level of the RF meter.

• Adjustment procedure

1. Transmit.
2. Connect the AG to the microphone socket and input the specified level at which RF 10 begins to light.
3. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

AD DTMF SINGLE TONE OUTPUT

• Adjustment function

Output a single tone to check the DTMF deviation.

• Display

• Remarks

The curve between 6 and full scale is obtained from the levels of menus AB and AC by line approximation. Only the A/D values for 2, 6, and full scale are stored in the EEPROM. The meter bars operate according to the currently set curve. The curve is calculated when the UP/DOWN key is pressed. The default is 171, approximately 3.35 V.

• Adjustment procedure

1. Confirm that "1633" is displayed. If "OFF" is displayed, press the F.LOCK/LOW key or the MIC UP/DOWN key to display "1633".
2. Transmit.
3. Check the deviation with a tester.

ADJUSTMENT

AE ALC START READ

- Adjustment function

Read the threshold voltage for microphone gain control by ALC.

- **Adjustment procedure**

1. Transmit
2. Input the level at which the ALC starts from the AG.
3. Press the F LOCK/LOW key or the MIC UP/DOWN key.

- **Display**

- Remarks

The level read in this menu is used as a threshold for the low and correct microphone gain. The default is 224, approximately 4.40 V.

AF ALC ZONE MAX. READ

- Adjustment function

Read the threshold voltage for microphone gain control by ALC.

- Adjustment procedure

1. Transmit.
2. Input the maximum level of the ALC zone from the AG.
3. Press the FLOCK/LOW key or the MIC UP/DOWN key.

- **Display**

- Remarks

The level read in this menu is used as a threshold for the correct and high microphone gain. The default is 82, approximately 1.60 V.

ADJUSTMENT

B0 ALC FULL SCALE READ

• Adjustment function

Read the threshold voltage for microphone gain control by ALC.

• Adjustment procedure

1. Transmit
2. Input the maximum + 6 dB level of the ALC zone from the AG.
3. Press the F.LOCK/LOW key or the MIC UP/DOWN key.

• Display

• Remarks

The level read in this menu is used as a threshold for the high and excessive microphone gain. The default is 56, approximately 1.10 V.

The input A/D value is displayed. (0-FFH)

The current A/D value for the threshold level stored in the microcomputer is displayed. (0-FFH)

B1 FM MICROPHONE GAIN

• Adjustment function

Set the low level for FM microphone gain.

• Adjustment procedure

1. Transmit.
2. Input the specified level from the AG.
3. Press the F.LOCK/LOW key or the MIC UP/DOWN key to change the microphone gain and obtain the specified deviation.

• Display

• Remarks

The high level is the level set in this menu + 6 dB.

Microphone gain level

ADJUSTMENT

B2 SSB MICROPHONE GAIN

• Adjustment function

Set the SSB microphone gain.

• Adjustment procedure

1. Transmit
2. Input the specified level from the AG.
3. Press the F.LOCK/LOW key or the MIC UP/DOWN key to change the microphone gain and obtain the specified output.

• Display

B3 WRITE INTO EEPROM

• Adjustment function

Write setting values into the EEPROM.

• Adjustment procedure

1. Press the F.LOCK/LOW key or UP/DOWN key.
2. While data is being written "run" is displayed.
3. If the data is written correctly, "good" is displayed.
4. If a write error occurs, "error" is displayed. If "error" is displayed repeatedly, press the key again. If "error" is still displayed repeatedly, check the EEPROM or other hardware for defects.

• Display

• Remarks

When this menu is selected and the key is pressed, the setting is written unconditionally even if it is not changed. Two sets of the same data are written into the EEPROM.

ADJUSTMENT

Test equipment for adjustment

1. Tester or Digital Volt Meter

- 1) Input resistance: $1M\Omega$
- 2) Voltage range: FS = 1.5 to 1000V AC/DC
A tester with high accuracy is acceptable, but beware that a precise reading is not possible when measuring high impedance circuits.

2. DC Ammeter

- 1) Voltage range: 5A, 10A, 20A

3. RF VTVM (RF V.M)

- 1) Input impedance: $1M\Omega$ or more, 3pF or less
- 2) Voltage range: FS = 10mV to 300V
- 3) Measurable frequency: 500MHz or more

4. AF Voltmeter (AF V.M)

- 1) Measurable frequency: 50Hz to 10kHz
- 2) Input resistance: $1M\Omega$ or more
- 3) Voltage range: FS = 10mV to 30 V

5. AF Generator (AG)

- 1) Frequency range: 100Hz to 10kHz
- 2) Output: Can limit range between a maximum of 1V and minimum of 1mV.
Low distortion factor

6. AF Dummy Load (AF DM)

- 1) Impedance: 8Ω
- 2) Capacity: 3W or more

7. Oscilloscope (oscillo, synchro)

Something that can get vertical amp frequency characteristics of 100MHz or more; external cycles with as much high sensitivity as possible.

8. Tracking Generator

- 1) Center frequency: 50kHz to 500MHz.
- 2) Frequency deviation: ± 35 MHz.
- 3) Output voltage: 100mV or more.

9. SSG (Standard Signal Generator)

- 1) Oscillation frequency: 50kHz to 500MHz
- 2) Output: -127dBm/0.1 μ V to 7dBm/0.5V
- 3) Output impedance: 50Ω
- 4) Should get AM and FM
Something with oscillation frequency that is stable at non-modulation and has small frequency modulation component.

10. Frequency Counter (f. counter)

- 1) Minimum input voltage: 50mV
- 2) Measurable frequency: 500MHz or more

11. Noise Generator

Something that generates noise that includes a high frequency component of up to 450MHz or more that is close to ignition noise.

12. RF Dummy Load (Dummy Load)

- 1) Impedance: 50Ω
- 2) Capacity: 50W or more

13. Power Meter (transit type and terminal type)

- 1) Measurable frequency: 500MHz or more
- 2) Impedance: 50Ω
- 3) Measuring range: 50W or more
When there is a 50Ω dummy load for RF use, only transit type is acceptable.

14. Spectrum Analyzer

- 1) Frequency measuring range: 100kHz to 500MHz or more
- 2) Resolution range: 1kHz to 3MHz
When there is no spectrum analyzer, an electric intensity measuring device is acceptable (measuring range: 10 to 500MHz)
Voltage: Something with 10 to 17V variability
Current: 20A or more

15. Linear Detector (LD)

Measurable Frequency: 500MHz or more

16. DC Power Source

Voltage: Something with 10 to 17 V variability
Current: 20A or more

17. Microphone with UP/DOWN

MC-47

18. Service Tools

Extension cables (3)

TM-255A/E

ADJUSTMENT

Adjustment service jig

This is a detailed electronic circuit board layout for a radio receiver. The board is populated with numerous components, including transistors (e.g., 2N4001, 2N4002, 2N4003, 2N4004, 2N4005, 2N4006, 2N4007, 2N4008, 2N4009, 2N4010, 2N4011, 2N4012, 2N4013, 2N4014, 2N4015, 2N4016, 2N4017, 2N4018, 2N4019, 2N4020, 2N4021, 2N4022, 2N4023, 2N4024, 2N4025, 2N4026, 2N4027, 2N4028, 2N4029, 2N4030, 2N4031, 2N4032, 2N4033, 2N4034, 2N4035, 2N4036, 2N4037, 2N4038, 2N4039, 2N4040, 2N4041, 2N4042, 2N4043, 2N4044, 2N4045, 2N4046, 2N4047, 2N4048, 2N4049, 2N4050, 2N4051, 2N4052, 2N4053, 2N4054, 2N4055, 2N4056, 2N4057, 2N4058, 2N4059, 2N4060, 2N4061, 2N4062, 2N4063, 2N4064, 2N4065, 2N4066, 2N4067, 2N4068, 2N4069, 2N4070, 2N4071, 2N4072, 2N4073, 2N4074, 2N4075, 2N4076, 2N4077, 2N4078, 2N4079, 2N4080, 2N4081, 2N4082, 2N4083, 2N4084, 2N4085, 2N4086, 2N4087, 2N4088, 2N4089, 2N4090, 2N4091, 2N4092, 2N4093, 2N4094, 2N4095, 2N4096, 2N4097, 2N4098, 2N4099, 2N4100), capacitors (e.g., 100pF, 1nF, 10nF, 100nF, 1μF, 10μF, 100μF, 1mF, 10mF, 100mF, 1F, 10F, 100F, 1mF, 10mF, 100mF, 1F, 10F, 100F), inductors (e.g., 100μH, 1mH, 10mH, 100mH, 1H, 10H, 100H, 1mH, 10mH, 100mH, 1H, 10H, 100H), and integrated circuits (e.g., 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800). The board also features a large circular cutout in the center, likely for a speaker or a large component. The layout is densely packed with components, and the board is labeled with various part numbers and values.

A diagram of a 3-pin transistor package, likely a TO-18 package. The package is shown in perspective, with three pins extending from the bottom. The pins are labeled from left to right as E (Emitter), B (Base), and C (Collector).

SPECIFICATION

Mic cable (E30-3153-05)

Speaker cable (E30-3200-05)

Panel cable (E30-3154-05)

DC cable (E30-3199-05)

DFK-7A Connection

Usable model: TM-255

PG-5A External View

TM-255A/E

SPECIFICATIONS

General

	TM-255A	TM-255E
Frequency range	144 MHz - 148 MHz	144 MHz - 146 MHz
Mode	J3E (LSB/USB), A1A (CW), F3E (FM)	
Number of memory channels	100	
Antenna impedance	50 Ω	
Usable temperature range	-20°C - +60°C	
Power supply	DC 13.8 V $\pm$ 15%	
Grounding method	Negative ground	
Current	Transmit (max.)	130 A or less
	Receive (no signal)	0.9 A or less
Frequency stability	-20°C - +60°C	Within $\pm 2.5 \times 10^{-6}$
	-20°C - +60°C (FM transmit)	Within $\pm 10 \times 10^{-6}$
Dimensions (W x H x D) (projections included)	180 mm x 60 mm x 215.5 mm (180 mm x 68.5 mm x 250 mm)	
Weight	Approx. 2.7 kg	

Transmitter

	TM-255A	TM-255E
Power output	High	Approx. 40 W
	Low	Approx. 5 W
Modulation	SSB	Balanced
	FM	Reactance
Spurious emissions	-60 dB or less	
Carrier suppression	40 dB or more	
Unwanted sideband suppression	40 dB or more	
Maximum frequency deviation (FM)	± 5 kHz or less	
Transmit frequency characteristics (SSB)	400 Hz to 2600 Hz (Within -6 dB)	
Audio distortion (at 60 % modulation)	7% or less	
Microphone impedance	600 Ω	

Receiver

	TM-255A	TM-255E
Circuitry	SSB/CW	Single conversion superheterodyne
	FM	Double conversion superheterodyne
Intermediate frequency	1st	10.695 MHz
	2nd	455 kHz (FM only)
Sensitivity	SSB, CW (10 dB (S+N)/N)	0.13 μ V or less
	FM (12 dB SINAD)	0.20 μ V or less
Selectivity (-6 dB)	SSB, CW	2.1 kHz or more
	FM	12 kHz or more
Selectivity (-60 dB)	SSB, CW	4.8 kHz or less
	FM	28 kHz or less
Squelch sensitivity	SSB, CW	0.13 μ V or less
	FM	0.09 μ V or less
Audio output (8 ohms, 5% distortion)	2W or more	
Audio output impedance	8 Ω	
RIT shift frequency range	10 Hz steps	± 1.1 kHz or more
	20 Hz steps	± 2.2 kHz or more
