

Service Manual

Model: KG-UVD1
Version: KG-UVD1-0905-V1

QUANZHOU WOUXUN ELECTRONICS CO., LTD

KG-UVD1 Dual-Band Maintenance Manual

Introduction

The Scope for the Manual

This manual is for the technicians who know well about the communication and have some experiences of maintenance. All necessary information of maintenance and actual published date are included in this manual.

If there is any change after publishing, we will complement it by “Maintenance Aviso” or “Manual Revision” according to the requirements.

Personal Safety

- Please pay attention to the below proceedings for your safety:

Don't transmit before you carefully check all plugs for TX Frequency, or any of the unfolded plugs doesn't connect to the relative ends.

- Please turn off the power, and don't operate the equipment when you are near the electric detonator or on flammability gas station.

- Only the qualified technicians can maintain the equipment.

Maintenance Service

In order to maintain the equipment easily and establish the complete maintenance system, we supply the information including principium chart, printing circuitry chart and the settings of the equipment.

Mode Combination

1. Mode Combination

PATTERN	FUNCTION
USER PATTERN	For normal use
COMPUTER PATTERN	Correspondence between the handset user and computer (IBM Compatible Machine)
DATA PROGRAMMING PATTERN	For reading out or reading in the frequency data and other functions
COMPUTER TEST PATTERN	For examining handset by computer
DUPLICATION PATTERN	For programming data reproduction from a handset to another

2.Enter the Mode

3.Computer Mode

KG-UVD1 handheld transceiver programs by computer, the programming connection and the programming software (KG-UVD1). The programming software can be used in the IBM computer or compatible machine.

Duplication Mode

1. “Duplication Mode” can copy the data of a handheld transceiver to another one.

The dealers can do this duplication without a personal computer.

2. Operating Method

- ① Connecting the duplicated source radio with waiting-duplicated target radio by cloning Line
(The waiting-duplicated target radio need to be putting through the power source)

② Pressing [MONI] key on duplicated source radio, the duplication starts.

When duplicating, the flickering red light means sending data. After duplicating successfully, the red light extinguishes, and the source radio enters the standby mode. If the red light keeps flickering, it means the duplication failed.

The green light flickers when the target radio duplicates. The duplication finishes when the green light extinguishes.

IFrequency Structure

Pic 1

Frequency Structure	A	C	B	D
(1)	136~ 174.995MHz	165.250~ 204.245MHz	400~ 470.995MHz	429.25~ 500.245MHz
(2)	136~ 174.995MHz	165.250~ 204.245MHz	450~ 520.995MHz	479.25~ 550.245MHz
(3)	136~ 174.995MHz	165.250~ 204.245MHz	245~ 245.995MHz	274.25~ 275.245MHz

Chart 1

Please refer the frequency of A.B.C.D points of PIC 1 on Chart 1.

The 1st intermediate frequency of this radio is 29.250MHz, the 2nd is 450KHz.

II Receiving

(1) The front end of U Band (RF Amplifier)

The signal which is received from the antenna enters the transmission/receive change-over switch diode circuit (D148, D137, D138 and D147), then goes through BPF (L191 and L192), and is enlarged by RF amplifier (T322). The signal goes through the BPF(L185,L189,L187,L188), and then enters the mixing. These BPF (D142, D143, D144, D145) is adjusted by the variable condenser. The input voltage by variable condenser is adjusted by the outputting voltage by microprocessor (IC811).(See PIC 2)

(2)The front end of V Band(RF Amplifier)

The signal which is received from the antenna enters the transmission/receive change-over switch diode circuit (D322, D315, D316 和 D443), then goes through BPF(L344 and L345), and is enlarged by RF amplifier (T324).The signal goes through the BPF (L320, L342, L341 L340), and then enters the mixing. These BPF (D318 D319, D320,D321)adjusted by the variable condenser. The input voltage by variable condenser is adjusted by the outputting voltage by microprocessor (IC811).(See PIC 2)

图2 PIC2

(3) The 1st Mixer

The signals from the front end of U Band and the Rx LO produced by PLL electrocircuit create the 1st immediate frequency signal of 29.250MHz on T144 Mixing. The created signal is sent to the changeover on-off on U/V Band.

The signals from the front end of V Band and the Rx LO produced by PLL electrocircuit create the 1st immediate frequency signal of 29.250MHz on T323 Mixing. The created signal is sent to the changeover on-off on U/V Band.

The changeover on-off switches the signals according to the working state of U/V Band on microprocessor (IC811). After switching, the signals are sent to MCF(FL515,FL516) (See PIC2)

(4) The enlarging circuit on Intermediate Frequency

The first signal from intermediate frequency eliminate the signals from adjacent channels through MCF(FL515,FL516). The amplifier (T520) enlarges and enters the I-F system chip (U516). The I-F system chip provides the second mixer, the second LO signal, limiting amplifier, orthogonal detector and RSSI (received signal intensity indicator). The second mixer sends and mixes the first intermediate frequency signal and the second LO signal of 28.8MHz, and then creates the second LO signal of 450kHz.

The second intermediate frequency signal keeps eliminating the signals of the adjacent channels by the chinaware wave filter. The second signal through filter is enlarged by limiting amplifier and demodulated by orthogonal detector with chinaware discriminator. The demodulated signal enters the tone circuit on microprocessor (IC811) and processes.(See PIC2)

(5) Wide/Narrow Switch Circuit

We can set the bandwidth of all channels by turning on the Wide/Narrow switch.

The data from Wide (low level) and Narrow (high level) is outputted by the 14th pin on microprocessors.

T528 is connected when receiving the data from WIDE (low level).

T528 is disconnected when receiving the data from NARROW (high level).

T528 is connected/ disconnected by WIDE/NARROW data. The regular changing level from U516 detector is used to maintain the constant output level on WIDE/NARROW signals. (See PIC3)

(6) Tone Amplifier Circuit

The demodulated signal is sent to the tone amplifier by T811 from the 25th feet tube of microprocessor (IC811), after entering the tone circuit and being processed.

After being enlarged by the tone power amplifier, the signal is outputted to the loudhailer by AF volume control. (See PIC 2)

(7) Squelch

A part of AF signals from FM IC (U516) enter IC again. The noise components are enlarged and revised by the filter, and then creates the DC voltage corresponded to the noise level.

The DC signal is sent to the simulated port (Pin28) of microprocessor through FM IC. IC405 decides whether outputs the sound from the speaker by testing the outputted voltage is higher or lower than the default value.

(See PIC4)

(8) Receiving Signaling (QT/DQT)

The signal from FM IC (U516) enters and is processed by microprocessor (IC811). (See PIC4)

Microprocessor (IC811) determines whether QT or DQT matches the setting value, and controls the output of P-SPK and loudhail by this result. (See PIC 4)

III PLL Frequency Syntheses

PLL circuit produces the Rx LO for receiving and the RF signal for transmitting. This transceiver is adopted double channel integrate circuit, which can simultaneously produce two different Rx LO and RF signal.

(1) PLL

The frequency step of PLL circuit is 5 or 6.25kHz.

The referring surge signal of 14.4MHz is divided frequency by a fixed arithmometer in U112. The signal from the oscillator (VCO) is cushioned and enlarged by T130 and T311 separately, and is divided frequency by programmable double modulation arithmometer separately in U112. In the U112 phase comparator, the frequency division processes compare. After being filtered by the different lowpass, the two created signals separately are sent to the two independent VCO controlling frequency of oscillator. See PIC 5

图5 PIC5

(2)VCO

①U Band VCO on the Transceiver

The frequency that is used in U Band on the transceiver is produced by T134 vibration when it is transmitting or receiving frequency points.

Through the phase comparator will receive transportation to the VCO control voltage variable diode (D132, D139, D131, D140) to control the oscillation frequency. Oscillation frequency of the signal by the T135, T135 amplification levels, with the D136 and D135 were sent to the RF amplifiers and receivers for the first points of the vibration frequency. See PIC5.

② V Band VCO on the Transceiver

The frequency that is used in V Band on the transceiver is produced by T325 vibration when it is transmitting or

receiving frequency points.

Through the phase comparator will receive transportation to the VCO control voltage variable diode (D324, D325, D327, D328) to control the oscillation frequency. Oscillation frequency of the signal by the T135, T135 amplification levels, with the D136 and D135 were sent to the RF amplifiers and receivers for the first points of the vibration frequency. See PIC5.

IV Transmitting Part System

(1) Speaker Amplifier

The signal from speaker processes regulation of the maximum frequency deviation by tone processor (U611). And then it is sent to VCO on U Band or V Band for modulating and inputting. See PIC 6

PIC6

(2) Drives and Terminal Amplifier

This transceiver has two separation drives and terminal amplifiers on U Band and V Band.

① Drives and Terminal Amplifier on U Band

The signal from T/R Switch (D136 ON) is enlarged to 50mW by pre-drive amplifier (T139,T140) and drive amplifier (T141). The output of drive amplifier is enlarged to 4.0W by the RF power amplifier (T142) (works as when low power is 1W). The output of RF power amplifier is through the harmonic filter (LPF) and the antenna switch (D148), and is sent to the terminal of the antenna .

See PIC 7

② Drives and Terminal Amplifier on V Band

The signal from T/R Switch (D312 ON) is enlarged to 50mW by pre-drive amplifier (T319,T320) and drive amplifier (T322). The output of drive amplifier is enlarged to 4.0W by the RF power amplifier (T322) ((works as when low power is 1W). The output of RF power amplifier is through the harmonic filter (LPF) and the antenna switch, and is sent to the terminal of the antenna (D322).

See PIC 7

PIC 7

(3) Automatic Power Control Circuit (APC)

APC circuit always monitor the circuit that is through the radio frequency RF amplifier (T142 or T322), and maintain the stable electric current. The diversification of electronic current that is enlarged by radio frequency power amplifier can cause the lower voltage of R615, R616, R659 and R660. The voltage is sent to difference amplifier U612(2/2) U612(1/2), and compares the outputting voltage of IC101(2/2) with the reference voltage from IC405. The output voltage of U612 (1/2) control the radio frequency RF amplifier, drive amplifier, VG of pre-drive amplifier to keep the voltage consistent.

The changes of high/low power are realized by changing the reference voltage.

The two terminal amplifiers of this transceiver use the same APC circuit. So they are switched on the output VG voltage from APC. When U Band transmitting, the VG voltage that sends APC to V Band resists to ground short circuit. On the contrary, when V Band transmitting, the VG voltage that sends APC to U Band resists to ground short circuit. See PIC7

(4) Coding Signaling

QT/DQT

The DQT/QT data outputs from the CPU 23 base pins. The signal through the low pass CR filter, a partial signal delivers TCXO CR112. Another part of signal and the tone signaling mix, then inputs separately to U or V Band of VCO.

V Electrical Power

10 electrical power of 5V is used in this transceiver.

They respectively provide to the microprocessor: 5V, 5M

When connecting, 5M always keep outputting. Although 5M is the regular output, it is closed when turn off the electrical power to prevent the microprocessor from malfunction.

5C-V is the public 5V on V Band, which keeps output on non-save mode.

5C-U is the public 5V on U Band, which keeps output on non-save mode.

5R-U is the receiving 5V on U Band, which keeps output during receiving.

5T-U is the transmitting 5V on U Band, which keeps output during transmitting.

5R-V is the receiving 5V on V Band, which keeps output during receiving.

5T-V is the transmitting 5V on V Band, which keeps output during transmitting.

5R is the shared 5V by the intermediate frequency circuit. (U band and V band of receiving use in common the partial power source).

The electrical power is used in enlarging the speaker (The shared partial electrical source on U Band and V Band)

There are another two overall electrical sources, BATT+ and BATT.

BATT+ is input electronic source. BATT is electronic source by controlled by power switch.

VI Controlled Electrical Circuit

The controlled circuit is made up of microprocessor (IC811) and exterior circuit.

It controls the TX-RX unit. The main functions of IC811 are as follows:

- (1) Transforming the transmitting and receiving states according to PTT input signal
- (2) Numerating system, group, frequency and program data from the stored circuit
- (3) Sending frequency data to PLL
- (4) Controlling the open and close of squelch according to the output DC voltage from squelch circuit.
- (5) Controlling the tone frequency mute according to the decoding data

VII Keypad and display circuit

- (1) Keyboard entry examination

K1, K2, K3, K4 are keypad fan-out, D1, D2, D3, D4 are keypad input end. They are managed after examining by microprocessor (IC811). See PIC8

图8

图9

(2) Display Circuit

LCD demonstrated the information (IC811) controls the screen by the microprocessor (liquid crystal) to demonstrate that the actuation integrated circuit causes the screen (liquid crystal) the monitor demonstration corresponding information. See PIC 10

PIC10

(3) Backlight Circuit

The backlight of LCD and keypad is single-colored, which is controlled by the pin of microprocessor. See PIC11

PIC11

(4) Illumination Circuit

The illumination circuit is controlled by the pin of the microprocessor(IC811). See PIC12

PIC 12

VIII Memorizer Circuit

The memorizer circuit is made up of CCPU (IC811) and EEPROM (U811)

The capacitance is 64k bits, including the handset controlling program by CPU and the operation function data.

See PIC13

PIC 13

IX Battery Low Voltage Prompt

Monitoring the battery voltage by microprocessor. The transceiver will sound when the voltage is lower than the alarm voltage. See PIC14

PIC 14

X Programming Communication

The transceiver communicates data with PC through RXD TXD on earphone seat.

See PIC 15

PIC 15

XI JP811 Terminal Function

Terminal Pin No.	NAME	INPUT & OUTPUT	Function Description
1	SP+	Output	SPK Output
2	MIC+	Input	MIC Input
3	BATT	Input	Input Electronic Source of Keypad backlight
4	5V	Input	LCD Drive IC & Input Electronic Source of LCD Backlight
5	GND		
6	GND		
7	GND		
8	LCD-CS	Output	IC始能端控制
9	(BATT-TEST) / LCD-RS	Output	Electronic Source Voltage Examination/ Read-Write End Control of LCD Drive IC
10	LAMP1	Output	Electronic Source Control of LCD Backlight
11	GND		
12	K1	Input	Keypad Matrix Input
13	K2	Input	Keypad Matrix Input
14	K3	Input	Keypad Matrix Input

15	K4	Input	Keypad Matrix Input
16	D1	Output	Keypad Matrix Output
17	D2	Output	Keypad Matrix Output
18	D3	Output	Keypad Matrix Output
19	D4	Output	Keypad Matrix Output
20	GND		

XII Terminal Function of Microprocessor (IC811)

Pin NO.	Tube Feet Name	Function Description
1	PLL-LE/ROM-WP	Phase-locked loop Data End/ Stored IC Write Protection Board
2	LAMP1	LCD Backlight Control
3	5SC-UHF	Control by (UHF) VCO Electrical Source
4	K1	Row Line 1 on K1 Keypad
5	K2	Row Line 2 on K2 Keypad
6	K3	Row Line 3 on K3 Keypad
7	K4	Row Line 4 on K4 Keypad
8	D1/PLL-CLK/ROM-CLK/MONI/LCD-D0	Line 1 on Keypad/Phase-locked Loop Clock/ Squelch Key/LCD Drive Data
9	D2/PLL-DATA/PF1/LCD-D1	Row Line 2 on Keypad/Phase-locked Loop Data/ Sidekey1/LCD Drive Data
10	D3/Viose-CLK/ (A/B) /LCD-D2	Row Line 3 on keypad/ Voice Clock/(A/B) Button/ LCD Drive Data
11	D4/PF2/LCD-D3	Row Line 4 on keypad/Topkey PF2/ LCD Drive Data
12	CN2	CN2 Channel Decoding Bit
13	CN1	CN1 Channel Decoding Bit
14	(N/W) /ROM-Data	Wide/Narrow Bandwidth Control/Packet Data
15	AVDD	
16	RXO	Microprocessor Audio Amplifier Output
17	RXI	Microprocessor Audio Amplifier Input
18	MICI	Microprocessor Audio Amplifier Output
19	MICO	Microprocessor Audio Amplifier Input
20	TONE/DTMF/Beep	Audio Signal Output/Double Audio Signal Output/Prompt Output
21	PLLC	
22	AVSS	
23	CTCSS/DCS/TUNE	CTCSS/DCS/Receiving Auto Track Gain Output
24	APC	Auto Power Control Voltage Output
25	AURX	Input End of Microprocessor Audio Channel
26	Batt-TEST/LCD-RS	Battery Voltage Sampling Input/LCD Drive IC Control End
27	VOX	MIC Sampling Data Input
28	ANSQL	Squelch Voltage Sample Input End
29	XIN	
30	XOUT	
31	VSS	
32	RESET	

33	VDD	
34	5SC-VHF	(VHF) VCO Electronic Source Control
35	P-TX/RX-VHF	(VHF)Transmitting/Receiving electronic source control
36	P-SPK	Audio Power Amplifier Electronic Power Control
37	LAMP2	Illumination Control
38	P-TX/RX-UHF	UHF Transmit/Receive Electronic Source Control
39	LCD_CS	LCD Drive CMOS chip
40	RXD/PTT	Communication Data Foot Input/Transmit Key Examination
41	Voice-BUSY/DTMF-STD	Voice Chip Busy Line Double Audio Decoding Valid Data Receiving Symbol Bite
42	FM-SDIO/Voice-DATA	Reception Chip Serial Data/Voice Chip Serial Data
43	GREEN	Controlled by Receiving Indicator Light
44	RED/TXD	Receiving Indicator Light/serial communication data foot outputs

XII Adjustment

Apparatus used in Adjustment: Lineless Integration Test Apparatus, Digital voltage-stabilized source, Digital Multimeters

Nominal Voltage:7.4V

6.2 Alarm Voltage Tone Power:0.5W

Test Contents	Test Points	Text Range	Test Value	Instrument/ Apparatus
VHF-VCO TX/RX	CV-V	136.000MHz	高于0.8	Digital Multimeters
VHF-VCO TX/RX	CV-V	174.995MHz	低于4.0V	Digital Multimeters
UHF-VCO TX/RX	CV-U	400.000MHZ	高于1.0V	Digital Multimeters
UHF-VCO TX-RX	CV-U	470.995MHZ	低于4.0V	Digital Multimeters

DCS Modulation Spoke		VHF/UHF	$0.3\text{KHz} \leq X \leq 0.7\text{KHz}$	Lineless Integration Test Apparatus
Debugging Characteristic		VHF/UHF	+3dB~-3dB	Lineless Integration Test Apparatus
VHF POWER		136~174.995MHz	$\geq 4.3\text{W}$	Lineless Integration Test Apparatus
UHF POWER		400~470.995MHz	$\geq 4.0\text{W}$	Lineless Integration Test Apparatus
